課程大綱 (Syllabus)

10 100/11/11 Business Models and Issues of Social Media Service
11 100/11/18 Paper Reading and Discussion
12 100/11/25 Seminar
13 100/12/02 Strategy of Social Media Service
14 100/12/09 Paper Reading and Discussion
15 100/12/16 Social Media Marketing
16 100/12/23 Social Network Analysis, Link Mining, Text Mining, Web Mining, and Opinion Mining in Social Media
17 100/12/30 Project Presentation and Discussion
18 101/01/06 期末考試週
Learning Objective

- Social Network Analysis
- Link Mining
- Text Mining
- Web Mining
- Opinion Mining in Social Media
Social Network Analysis

• A social network is a social structure of people, related (directly or indirectly) to each other through a common relation or interest

• Social network analysis (SNA) is the study of social networks to understand their structure and behavior

Source: (c) Jaideep Srivastava, srivasta@cs.umn.edu, Data Mining for Social Network Analysis
Social Network Analysis

• Using Social Network Analysis, you can get answers to questions like:
  – How highly connected is an entity within a network?
  – What is an entity's overall importance in a network?
  – How central is an entity within a network?
  – How does information flow within a network?

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Alice has the highest degree centrality, which means that she is quite active in the network. However, she is not necessarily the most powerful person because she is only directly connected within one degree to people in her clique—she has to go through Rafael to get to other cliques.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis: Degree Centrality

• Degree centrality is simply the number of direct relationships that an entity has.

• An entity with high degree centrality:
  – Is generally an active player in the network.
  – Is often a connector or hub in the network.
  – s not necessarily the most connected entity in the network (an entity may have a large number of relationships, the majority of which point to low-level entities).
  – May be in an advantaged position in the network.
  – May have alternative avenues to satisfy organizational needs, and consequently may be less dependent on other individuals.
  – Can often be identified as third parties or deal makers.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Rafael has the highest betweenness because he is between Alice and Aldo, who are between other entities. Alice and Aldo have a slightly lower betweenness because they are essentially only between their own cliques. Therefore, although Alice has a higher degree centrality, Rafael has more importance in the network in certain respects.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis: Betweenness Centrality

• Betweenness centrality identifies an entity's position within a network in terms of its ability to make connections to other pairs or groups in a network.

• An entity with a high betweenness centrality generally:
  – Holds a favored or powerful position in the network.
  – Represents a single point of failure—take the single betweenness spanner out of a network and you sever ties between cliques.
  – Has a greater amount of influence over what happens in a network.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis:
Closeness Centrality

Rafael has the highest closeness centrality because he can reach more entities through shorter paths. As such, Rafael's placement allows him to connect to entities in his own clique, and to entities that span cliques.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis: Closeness Centrality

• Closeness centrality measures how quickly an entity can access more entities in a network.
• An entity with a high closeness centrality generally:
  – Has quick access to other entities in a network.
  – Has a short path to other entities.
  – Is close to other entities.
  – Has high visibility as to what is happening in the network.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Alice and Rafael are closer to other highly close entities in the network. Bob and Frederica are also highly close, but to a lesser value.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis: Eigenvalue

• Eigenvalue measures how close an entity is to other highly close entities within a network. In other words, Eigenvalue identifies the most central entities in terms of the global or overall makeup of the network.

• A high Eigenvalue generally:
  – Indicates an actor that is more central to the main pattern of distances among all entities.
  – Is a reasonable measure of one aspect of centrality in terms of positional advantage.

Hubs are entities that point to a relatively large number of authorities. They are essentially the mutually reinforcing analogues to authorities. Authorities point to high hubs. Hubs point to high authorities. You cannot have one without the other.

Source: http://www.fmsasg.com/SocialNetworkAnalysis/
Social Network Analysis: Hub and Authority

• Entities that many other entities point to are called Authorities. In Sentinel Visualizer, relationships are directional—they point from one entity to another.

• If an entity has a high number of relationships pointing to it, it has a high authority value, and generally:
  – Is a knowledge or organizational authority within a domain.
  – Acts as definitive source of information.

Link Mining

Link Mining: Models, Algorithms, and Applications

Philip S. Yu · Jiawei Han
Christos Faloutsos Editors

Link Mining
(Getoor & Diehl, 2005)

• Link Mining
  – Data Mining techniques that take into account the links between objects and entities while building predictive or descriptive models.

• Link based object ranking, Group Detection, Entity Resolution, Link Prediction

• Application:
  – Hyperlink Mining
  – Relational Learning
  – Inductive Logic Programming
  – Graph Mining
Characteristics of Collaboration Networks
(Newman, 2001; 2003; 3004)

- Degree distribution follows a power-law
- Average separation decreases in time.
- Clustering coefficient decays with time
- Relative size of the largest cluster increases
- Average degree increases
- Node selection is governed by preferential attachment

Source: (c) Jaideep Srivastava, srivasta@cs.umn.edu, Data Mining for Social Network Analysis
Social Network Techniques

- Social network extraction/construction
- Link prediction
- Approximating large social networks
- Identifying prominent/trusted/expert actors in social networks
- Search in social networks
- Discovering communities in social network
- Knowledge discovery from social network
Social Network Extraction

• Mining a social network from data sources
• Three sources of social network (Hope et al., 2006)
  – Content available on web pages
    • E.g., user homepages, message threads
  – User interaction logs
    • E.g., email and messenger chat logs
  – Social interaction information provided by users
    • E.g., social network service websites (Facebook)
Social Network Extraction

• IR based extraction from web documents
  – Construct an “actor-by-term” matrix
  – The terms associated with an actor come from web pages/documents created by or associated with that actor
  – IR techniques (TF-IDF, LSI, cosine matching, intuitive heuristic measures) are used to quantify similarity between two actors’ term vectors
  – The similarity scores are the edge label in the network
    • Thresholds on the similarity measure can be used in order to work with binary or categorical edge labels
    • Include edges between an actor and its k-nearest neighbors
  • Co-occurrence based extraction from web documents

Source: (c) Jaideep Srivastava, srivasta@cs.umn.edu, Data Mining for Social Network Analysis
Link Prediction

• Link Prediction using supervised learning (Hasan et al., 2006)
  – Citation Network (BIOBASE, DBLP)
  – Use machine learning algorithms to predict future co-authorship
    • Decision three, k-NN, multilayer perceptron, SVM, RBF network
  – Identify a group of features that are most helpful in prediction
  – Best Predictor Features
    • Keywork Match count, Sum of neighbors, Sum of Papers, Shortest distance

Source: (c) Jaideep Srivastava, srivasta@cs.umn.edu, Data Mining for Social Network Analysis
Identifying Prominent Actors in a Social Network

• Compute scores/ranking over the set (or a subset) of actors in the social network which indicate degree of importance / expertise / influence
  – E.g., Pagerank, HITS, centrality measures

• Various algorithms from the link analysis domain
  – PageRank and its many variants
  – HITS algorithm for determining authoritative sources

• Centrality measures exist in the social science domain for measuring importance of actors in a social network
Identifying Prominent Actors in a Social Network

• Brandes, 2011
• Prominence → high betweenness value
• Betweenness centrality requires computation of number of shortest paths passing through each node
• Compute shortest paths between all pairs of vertices
Text and Web Mining

- Text Mining: Applications and Theory
- Web Mining and Social Networking
- Mining the Social Web: Analyzing Data from Facebook, Twitter, LinkedIn, and Other Social Media Sites
- Web Data Mining: Exploring Hyperlinks, Contents, and Usage Data
- Search Engines – Information Retrieval in Practice
Text Mining
Web Mining and Social Networking

Search Engines: Information Retrieval in Practice

http://www.amazon.com/Search-Engines-Information-Retrieval-Practice/dp/0136072240
Text Mining

• Text mining (text data mining)
  – the process of deriving high-quality information from text

• Typical text mining tasks
  – text categorization
  – text clustering
  – concept/entity extraction
  – production of granular taxonomies
  – sentiment analysis
  – document summarization
  – entity relation modeling
    • i.e., learning relations between named entities.
Web Mining

• Web mining
  – discover useful information or knowledge from the **Web hyperlink structure, page content, and usage data.**

• Three types of web mining tasks
  – Web structure mining
  – Web content mining
  – Web usage mining

Text Mining Concepts

• 85-90 percent of all corporate data is in some kind of unstructured form (e.g., text)
• Unstructured corporate data is doubling in size every 18 months
• Tapping into these information sources is not an option, but a need to stay competitive
• Answer: text mining
  – A semi-automated process of extracting knowledge from unstructured data sources
  – a.k.a. text data mining or knowledge discovery in textual databases

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Data Mining versus Text Mining

• Both seek for novel and useful patterns
• Both are semi-automated processes
• Difference is the nature of the data:
  – Structured versus unstructured data
  – **Structured data:** in databases
  – **Unstructured data:** Word documents, PDF files, text excerpts, XML files, and so on
• Text mining – first, impose structure to the data, then mine the structured data

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Concepts

• Benefits of text mining are obvious especially in text-rich data environments
  – e.g., law (court orders), academic research (research articles), finance (quarterly reports), medicine (discharge summaries), biology (molecular interactions), technology (patent files), marketing (customer comments), etc.

• Electronic communication records (e.g., Email)
  – Spam filtering
  – Email prioritization and categorization
  – Automatic response generation

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Application Area

- Information extraction
- Topic tracking
- Summarization
- Categorization
- Clustering
- Concept linking
- Question answering

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Terminology

- Unstructured or semistructured data
- Corpus (and corpora)
- Terms
- Concepts
- Stemming
- Stop words (and include words)
- Synonyms (and polysemes)
- Tokenizing

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Terminology

• Term dictionary
• Word frequency
• Part-of-speech tagging (POS)
• Morphology
• Term-by-document matrix (TDM)
  – Occurrence matrix
• Singular Value Decomposition (SVD)
  – Latent Semantic Indexing (LSI)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining for Patent Analysis

• What is a patent?
  – “exclusive rights granted by a country to an inventor for a limited period of time in exchange for a disclosure of an invention”

• How do we do patent analysis (PA)?

• Why do we need to do PA?
  – What are the benefits?
  – What are the challenges?

• How does text mining help in PA?

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Natural Language Processing (NLP)

• Structuring a collection of text
  – Old approach: bag-of-words
  – New approach: natural language processing

• NLP is ...
  – a very important concept in text mining
  – a subfield of artificial intelligence and computational linguistics
  – the studies of "understanding" the natural human language

• Syntax versus semantics based text mining

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Natural Language Processing (NLP)

• What is “Understanding”?
  – Human understands, what about computers?
  – Natural language is vague, context driven
  – True understanding requires extensive knowledge of a topic

  – Can/will computers ever understand natural language the same/accurate way we do?

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Natural Language Processing (NLP)

• Challenges in NLP
  – Part-of-speech tagging
  – Text segmentation
  – Word sense disambiguation
  – Syntax ambiguity
  – Imperfect or irregular input
  – Speech acts

• Dream of AI community
  – to have algorithms that are capable of automatically reading and obtaining knowledge from text

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Natural Language Processing (NLP)

• WordNet
  – A laboriously hand-coded database of English words, their definitions, sets of synonyms, and various semantic relations between synonym sets
  – A major resource for NLP
  – Need automation to be completed

• Sentiment Analysis
  – A technique used to detect favorable and unfavorable opinions toward specific products and services
  – CRM application

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
NLP Task Categories

- Information retrieval (IR)
- Information extraction (IE)
- Named-entity recognition (NER)
- Question answering (QA)
- Automatic summarization
- Natural language generation and understanding (NLU)
- Machine translation (ML)
- Foreign language reading and writing
- Speech recognition
- Text proofing
- Optical character recognition (OCR)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Applications

• Marketing applications
  – Enables better CRM

• Security applications
  – ECHELON, OASIS
  – Deception detection (...)

• Medicine and biology
  – Literature-based gene identification (...)

• Academic applications
  – Research stream analysis

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Applications

• Application Case: Mining for Lies
• Deception detection
  – A difficult problem
  – If detection is limited to only text, then the problem is even more difficult
• The study
  – analyzed text based testimonies of person of interests at military bases
  – used only text-based features (cues)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Applications

• Application Case: Mining for Lies

Text Mining Process

The three-step text mining process

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Process

• **Step 1:** Establish the corpus
  – Collect all relevant unstructured data
    (e.g., textual documents, XML files, emails, Web pages, short notes, voice recordings...)
  – Digitize, standardize the collection
    (e.g., all in ASCII text files)
  – Place the collection in a common place
    (e.g., in a flat file, or in a directory as separate files)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
## Text Mining Process

- **Step 2: Create the Term–by–Document Matrix**

| Terms                    | investment risk | project management | software engineering | development | SAP | ...
|--------------------------|-----------------|---------------------|-----------------------|-------------|-----|---------
| Documents                |                 |                     |                       |             |     |         |
| Document 1               | 1               |                     |                       | 1           |     |         |
| Document 2               |                 |                     |                       | 1           |     |         |
| Document 3               |                 |                     | 3                      | 1           |     |         |
| Document 4               |                 |                     |                       | 1           |     |         |
| Document 5               |                 |                     | 2                      | 1           |     |         |
| Document 6               | 1               |                     |                       | 1           |     |         |
| ...                      |                 |                     |                       |             |     |         |

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Process

• **Step 2:** Create the Term–by–Document Matrix (TDM), cont.
  
  – Should all terms be included?
    • Stop words, include words
    • Synonyms, homonyms
    • Stemming
  
  – What is the best representation of the indices (values in cells)?
    • Row counts; binary frequencies; log frequencies;
    • Inverse document frequency

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Process

• Step 2: Create the Term–by–Document Matrix (TDM), cont.

  – TDM is a sparse matrix. How can we reduce the dimensionality of the TDM?
    • Manual - a domain expert goes through it
    • Eliminate terms with very few occurrences in very few documents (?)
    • Transform the matrix using singular value decomposition (SVD)
    • SVD is similar to principle component analysis

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Process

• **Step 3: Extract patterns/knowledge**
  – Classification (text categorization)
  – Clustering (natural groupings of text)
    • Improve search recall
    • Improve search precision
    • Scatter/gather
    • Query-specific clustering
  – Association
  – Trend Analysis (...)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Text Mining Application
(research trend identification in literature)

• Mining the published IS literature
  – MIS Quarterly (MISQ)
  – Journal of MIS (JMIS)
  – Information Systems Research (ISR)
  – Covers 12-year period (1994-2005)
  – 901 papers are included in the study
  – Only the paper abstracts are used
  – 9 clusters are generated for further analysis

Web Mining Overview

• Web is the largest repository of data
• Data is in HTML, XML, text format
• Challenges (of processing Web data)
  – The Web is too big for effective data mining
  – The Web is too complex
  – The Web is too dynamic
  – The Web is not specific to a domain
  – The Web has everything

• Opportunities and challenges are great!

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Web Mining

- Web mining (or Web data mining) is the process of discovering intrinsic relationships from Web data (textual, linkage, or usage)

Web Mining

- **Web Content Mining**
  Source: unstructured textual content of the Web pages (usually in HTML format)

- **Web Structure Mining**
  Source: the unified resource locator (URL) links contained in the Web pages

- **Web Usage Mining**
  Source: the detailed description of a Web site’s visits (sequence of clicks by sessions)

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Web Content/Structure Mining

• Mining of the textual content on the Web
• Data collection via Web crawlers
• Web pages include hyperlinks
  – Authoritative pages
  – Hubs
  – hyperlink-induced topic search (HITS) alg

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Web Usage Mining

• Extraction of information from data generated through Web page visits and transactions...
  – data stored in server access logs, referrer logs, agent logs, and client-side cookies
  – user characteristics and usage profiles
  – metadata, such as page attributes, content attributes, and usage data

• Clickstream data

• Clickstream analysis

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Web Usage Mining

• Web usage mining applications
  – Determine the lifetime value of clients
  – Design cross-marketing strategies across products.
  – Evaluate promotional campaigns
  – Target electronic ads and coupons at user groups based on user access patterns
  – Predict user behavior based on previously learned rules and users' profiles
  – Present dynamic information to users based on their interests and profiles...

Source: Turban et al. (2011), Decision Support and Business Intelligence Systems
Web Usage Mining
(clickstream analysis)

Pre-Process Data
- Collecting
- Merging
- Cleaning
- Structuring
  - Identify users
  - Identify sessions
  - Identify page views
  - Identify visits

Extract Knowledge
- Usage patterns
- User profiles
- Page profiles
- Visit profiles
- Customer value

User / Customer
Website
Weblogs

How to better the data
How to improve the Web site
How to increase the customer value

Opinion Mining and Sentiment Analysis: NLP Meets Social Sciences

Bing Liu
Department of Computer Science
University Of Illinois at Chicago

http://www.cs.uic.edu/~liub/FBS/sentiment-analysis.html
Opinion Mining

• Two main types of textual information.
  – Facts and Opinions
    • Note: factual statements can imply opinions too.

• Most current text information processing methods (e.g., web search, text mining) work with factual information.

• Sentiment analysis or opinion mining
  – computational study of opinions, sentiments and emotions expressed in text.

• Why opinion mining now? Mainly because of the Web; huge volumes of opinionated text.

Opinion Mining
user-generated media

• Importance of opinions:
  – Opinions are important because whenever we need to make a decision, we want to hear others’ opinions.
  – In the past,
    • Individuals: opinions from friends and family
    • Businesses: surveys, focus groups, consultants ...

• Word-of-mouth on the Web
  – User-generated media: One can express opinions on anything in reviews, forums, discussion groups, blogs ...
  – Opinions of global scale: No longer limited to:
    • Individuals: one’s circle of friends
    • Businesses: Small scale surveys, tiny focus groups, etc.

A Fascinating Problem!

• Intellectually challenging & major applications.
  – A popular research topic in recent years in NLP and Web data mining.
  – 20-60 companies in USA alone

• It touches every aspect of NLP and yet is restricted and confined.
  – Little research in NLP/Linguistics in the past.

• Potentially a major technology from NLP.
  – But “not yet” and not easy!
  – Data sourcing and data integration are hard too!

An Example Review

• “I bought an iPhone a few days ago. It was such a nice phone. The touch screen was really cool. The voice quality was clear too. Although the battery life was not long, that is ok for me. However, my mother was mad with me as I did not tell her before I bought the phone. She also thought the phone was too expensive, and wanted me to return it to the shop. ...”

• What do we see?
  – Opinions, targets of opinions, and opinion holders

**Target Object** (Liu, Web Data Mining book, 2006)

- **Definition (object):** An *object* o is a product, person, event, organization, or topic. o is represented as
  - a hierarchy of components, sub-components, and so on.
  - Each node represents a component and is associated with a set of attributes of the component.

![Diagram of object hierarchy](image)

- An opinion can be expressed on any node or attribute of the node.
- To simplify our discussion, we use the term *features* to represent both components and attributes.

What is an Opinion?
(Liu, a Ch. in NLP handbook)

• An opinion is a quintuple
  \((o_j, f_{jk}, so_{ijkl}, h_i, t_l)\),
  
where

– \(o_j\) is a target object.

– \(f_{jk}\) is a feature of the object \(o_j\).

– \(so_{ijkl}\) is the sentiment value of the opinion of the opinion holder \(h_i\) on feature \(f_{jk}\) of object \(o_j\) at time \(t_l\).
  \(so_{ijkl}\) is +ve, -ve, or neu, or a more granular rating.

– \(h_i\) is an opinion holder.

– \(t_l\) is the time when the opinion is expressed.
Objective – structure the unstructured

• **Objective**: Given an opinionated document,
  – Discover all quintuples \((o_j, f_{jk}, so_{ijkl}, h_i, t_l)\),
    • i.e., mine the five corresponding pieces of information in each quintuple, and
  – Or, solve some simpler problems

• With the quintuples,
  – **Unstructured Text → Structured Data**
    • Traditional data and visualization tools can be used to slice, dice and visualize the results in all kinds of ways
    • Enable qualitative and quantitative analysis.

Sentiment Classification: doc-level

- Classify a document (e.g., a review) based on the overall sentiment expressed by opinion holder
  - Classes: Positive, or negative (and neutral)

- In the model, \((o_j, f_{jk}, so_{ijkl}, h_i, t_l)\),

- It assumes
  - Each document focuses on a single object and contains opinions from a single opinion holder.
  - It considers opinion on the object, \(o_j \text{ (or } o_j = f_{jk})\)
Subjectivity Analysis
(Wiebe et al 2004)

• Sentence-level sentiment analysis has two tasks:
  – **Subjectivity classification**: Subjective or objective.
    • **Objective**: e.g., *I bought an iPhone a few days ago.*
    • **Subjective**: e.g., *It is such a nice phone.*
  – **Sentiment classification**: For subjective sentences or clauses, classify positive or negative.
    • **Positive**: *It is such a nice phone.*

• **However.** (Liu, Chapter in NLP handbook)
  – subjective sentences ≠ +ve or –ve opinions
    • E.g., *I think he came yesterday.*
  – Objective sentence ≠ no opinion
    • Imply –ve opinion: *My phone broke in the second day.*

Feature-Based Sentiment Analysis

• Sentiment classification at both document and sentence (or clause) levels are not sufficient,
  – they do not tell what people like and/or dislike
  – A positive opinion on an object does not mean that the opinion holder likes everything.
  – An negative opinion on an object does not mean …..

• Objective: Discovering all quintuples
  \((o_j, f_{jk}, s_{ijkl}, h_i, t_l)\)

• With all quintuples, all kinds of analyses become possible.

“I bought an iPhone a few days ago. It was such a nice phone. The touch screen was really cool. The voice quality was clear too. Although the battery life was not long, that is ok for me. However, my mother was mad with me as I did not tell her before I bought the phone. She also thought the phone was too expensive, and wanted me to return it to the shop. ...”

Feature-Based Opinion Summary
(Hu & Liu, KDD-2004)

Feature Based Summary:

Feature1: Touch screen
Positive: 212
• The touch screen was really cool.
• The touch screen was so easy to use and can do amazing things.

... Negative: 6
• The screen is easily scratched.
• I have a lot of difficulty in removing finger marks from the touch screen.

... Feature2: battery life

...
Visual Comparison (Liu et al. WWW-2005)

- Summary of reviews of Cell Phone 1
- Comparison of reviews of Cell Phone 1 and Cell Phone 2

Live Demo: OpinionEQ
(I gave a live demo of the OpinionEQ system. Some screensdumps from the demo are shown here)

• It performs feature-based sentiment analysis.

**Demo 1:** Compare consumer opinions on three GPS systems, **Garmin, Magellan, Tomtom**.
  – Based on a set of features, **price, map, software, quality, size**, etc.

**Demo 2:** Instant page analysis
  – The user gives a URL, and the system identifies opinions on the page instantly.

• We also have a Twitter opinion monitoring system (not demo-ed)

Demo 1: Compare 3 GSPs on different features

• Each bar shows the proportion of +ve opinion

Demo 1: Detail opinion sentences

• You can click on any bar to see the opinion sentences. Here are negative opinion sentences on the maps feature of Garmin.

• The pie chart gives the proportions of opinions.

Demo 1: # of feature mentions

- People talked a lot about prices than other features. They are quite positive about price, but not about maps and software.

Demo 1: Aggregate opinion trend

• More complains in July - Aug, and in Oct – Dec!

Other goodies of OpinionEQ

• Allow the user to choose
  – Products/brands,
  – Features
  – Sites
  – Time periods
  for opinion comparison.

• Work on an individual feature for detailed analysis.

• Allow the user to see the full opinion text and also the actual page in the site from where the opinion text was extracted.

Demo 2 – Instant page analysis

- Given a URL, it automatically identifies opinions on the page. Green: +ve, and red: -ve

Demo 2 – Instant page analysis

• It also extract the opinions in the page and list them.

<td>10. Bought it in December 1996 wholesale for $13 (more than 13 years ago)and i'm still using it EVERYDAY.. Bottom line: Very Very Very accurate and durable BUT temperture show</td>
</tr>
</tbody>
</table>
Sentiment Analysis is Challenging!

• “This past Saturday, I bought a Nokia phone and my girlfriend bought a Motorola phone with Bluetooth. We called each other when we got home. The voice on my phone was not so clear, worse than my previous phone. The battery life was long. My girlfriend was quite happy with her phone. I wanted a phone with good sound quality. So my purchase was a real disappointment. I returned the phone yesterday.”

An Example Practice of Review Spam

Belkin International, Inc

- Top networking and peripherals manufacturer | Sales ~ $500 million in 2008
- Posted an ad for writing fake reviews on amazon.com (65 cents per review)

Experiments with Amazon Reviews

• June 2006
  – 5.8mil reviews, 1.2mil products and 2.1mil reviewers.
• A review has 8 parts
  • <Product ID> <Reviewer ID> <Rating> <Date> <Review Title> <Review Body> <Number of Helpful feedbacks> <Number of Feedbacks> <Number of Helpful Feedbacks>
• Industry manufactured products “mProducts”
  e.g. electronics, computers, accessories, etc
  – 228K reviews, 36K products and 165K reviewers.

Some Tentative Results

• Negative outlier reviews tend to be heavily spammed.
• Those reviews that are the only reviews of some products are likely to be spammed.
• Top-ranked reviewers are more likely to be spammers.
• Spam reviews can get good helpful feedbacks and non-spam reviews can get bad feedbacks.

Meeting Social Sciences

• Extract and analyze political opinions.
  – Candidates and issues

• Compare opinions across cultures and lang.
  – Comparing opinions of people from different countries on the same issue or topic, e.g., Internet diplomacy

• Opinion spam (fake opinions)
  – What are social, culture, economic aspects of it?

• Opinion propagation in social contexts

• How opinions on the Web influence the real world
  – Are they correlated?

• Emotion analysis in social context & virtual world
Opinion Mining and Sentiment Analysis

• We briefly defined sentiment analysis problem.
  – Direct opinions: focused on feature level analysis
  – Comparative opinions: different types of comparisons
  – Opinion spam detection: fake reviews.

• A lot of applications.

• Interested in collaboration with social scientists
  – opinions and related issues are inherently social.
More details can be found in

- Download from: http://www.cs.uic.edu/~liub/FBS/sentiment-analysis.html

Processing Text

• Converting documents to *index terms*

• Why?
  – Matching the exact string of characters typed by the user is too restrictive
    • i.e., it doesn’t work very well in terms of effectiveness
  – Not all words are of equal value in a search
  – Sometimes not clear where words begin and end
    • Not even clear what a word is in some languages
      – e.g., Chinese, Korean
Text Statistics

• Huge variety of words used in text but
• Many statistical characteristics of word occurrences are predictable
  – e.g., distribution of word counts
• Retrieval models and ranking algorithms depend heavily on statistical properties of words
  – e.g., important words occur often in documents but are not high frequency in collection

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing

• Forming words from sequence of characters
• Surprisingly complex in English, can be harder in other languages
• Early IR systems:
  – any sequence of alphanumeric characters of length 3 or more
  – terminated by a space or other special character
  – upper-case changed to lower-case

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing

• Example:
  – “Bigcorp's 2007 bi-annual report showed profits rose 10%.” becomes
  – “bigcorp 2007 annual report showed profits rose”

• Too simple for search applications or even large-scale experiments

• Why? Too much information lost
  – Small decisions in tokenizing can have major impact on effectiveness of some queries

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing Problems

• Small words can be important in some queries, usually in combinations
  • xp, ma, pm, ben e king, el paso, master p, gm, j lo, world war II

• Both hyphenated and non-hyphenated forms of many words are common
  – Sometimes hyphen is not needed
    • e-bay, wal-mart, active-x, cd-rom, t-shirts
  – At other times, hyphens should be considered either as part of the word or a word separator
    • winston-salem, mazda rx-7, e-cards, pre-diabetes, t-mobile, spanish-speaking

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing Problems

• Special characters are an important part of tags, URLs, code in documents

• Capitalized words can have different meaning from lower case words
  – Bush, Apple

• Apostrophes can be a part of a word, a part of a possessive, or just a mistake
  – rosie o'donnell, can't, don't, 80's, 1890's, men's straw hats, master's degree, england's ten largest cities, shriner's

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing Problems

• Numbers can be important, including decimals
  – nokia 3250, top 10 courses, united 93, quicktime 6.5 pro, 92.3 the beat, 288358

• Periods can occur in numbers, abbreviations, URLs, ends of sentences, and other situations
  – I.B.M., Ph.D., cs.umass.edu, F.E.A.R.

• Note: tokenizing steps for queries must be identical to steps for documents

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing Process

• First step is to use parser to identify appropriate parts of document to tokenize
• Defer complex decisions to other components
  – word is any sequence of alphanumerical characters, terminated by a space or special character, with everything converted to lower-case
  – everything indexed
  – example: 92.3 → 92 3 but search finds documents with 92 and 3 adjacent
  – incorporate some rules to reduce dependence on query transformation components

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Tokenizing Process

• Not that different than simple tokenizing process used in past

• Examples of rules used with TREC
  – Apostrophes in words ignored
    • o’connor → oconnor  bob’s → bobs
  – Periods in abbreviations ignored
    • I.B.M. → ibm  Ph.D. → ph d

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Stopping

• Function words (determiners, prepositions) have little meaning on their own
• High occurrence frequencies
• Treated as stopwords (i.e. removed)
  – reduce index space, improve response time, improve effectiveness
• Can be important in combinations
  – e.g., “to be or not to be”

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Stopping

• Stopword list can be created from high-frequency words or based on a standard list
• Lists are customized for applications, domains, and even parts of documents
  – e.g., “click” is a good stopword for anchor text
• Best policy is to index all words in documents, make decisions about which words to use at query time

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Stemming

• Many morphological variations of words
  – *inflectional* (plurals, tenses)
  – *derivational* (making verbs nouns etc.)
• In most cases, these have the same or very similar meanings
• Stemmers attempt to reduce morphological variations of words to a common stem
  – usually involves removing suffixes
• Can be done at indexing time or as part of query processing (like stopwords)

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Stemming

• Generally a small but significant effectiveness improvement
  – can be crucial for some languages
  – e.g., 5-10% improvement for English, up to 50% in Arabic

<table>

Words with the Arabic root ktb
Stemming

• Two basic types
  – Dictionary-based: uses lists of related words
  – Algorithmic: uses program to determine related words

• Algorithmic stemmers
  – \textit{suffix-s}: remove ‘s’ endings assuming plural
    • e.g., cats $\rightarrow$ cat, lakes $\rightarrow$ lake, wiis $\rightarrow$ wii
    • Many \textit{false negatives}: supplies $\rightarrow$ supplie
    • Some \textit{false positives}: ups $\rightarrow$ up

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Porter Stemmer

• Algorithmic stemmer used in IR experiments since the 70s
• Consists of a series of rules designed to the longest possible suffix at each step
• Effective in TREC
• Produces *stems* not *words*
• Makes a number of errors and difficult to modify

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Porter Stemmer

• Example step (1 of 5)

Step 1a:

- Replace *sses* by *ss* (e.g., *stresses → stress*).
- Delete *s* if the preceding word part contains a vowel not immediately before the *s* (e.g., *gaps → gap* but *gas → gas*).
- Replace *ied* or *ies* by *i* if preceded by more than one letter, otherwise by *ie* (e.g., *ties → tie*, *cries → cri*).
- If suffix is *us* or *ss* do nothing (e.g., *stress → stress*).

Step 1b:

- Replace *eed*, *eedly* by *ee* if it is in the part of the word after the first non-vowel following a vowel (e.g., *agreed → agree*, *feed → feed*).
- Delete *ed*, *edly*, *ing*, *ingly* if the preceding word part contains a vowel, and then if the word ends in *at*, *bl*, or *iz* add *e* (e.g., *fished → fish*, *pirating → pirate*), or if the word ends with a double letter that is not *ll*, *ss* or *zz*, remove the last letter (e.g., *falling → fall*, *dripping → drip*), or if the word is short, add *e* (e.g., *hoping → hope*).
- Whew!

- Porter2 stemmer addresses some of these issues
- Approach has been used with other languages

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Krovetz Stemmer

• Hybrid algorithmic-dictionary
  – Word checked in dictionary
    • If present, either left alone or replaced with “exception”
    • If not present, word is checked for suffixes that could be removed
      • After removal, dictionary is checked again

• Produces words not stems

• Comparable effectiveness

• Lower false positive rate, somewhat higher false negative

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Stemmer Comparison

Original text:
Document will describe marketing strategies carried out by U.S. companies for their agricultural chemicals, report predictions for market share of such chemicals, or report market statistics for agrochemicals, pesticide, herbicide, fungicide, insecticide, fertilizer, predicted sales, market share, stimulate demand, price cut, volume of sales.

Porter stemmer:
document describ market strategi carri compani agricultur chemic report predict market share chemic report market statist agrochem pesticid herbicid fungicid insecticid fertil predict sale market share stimul demand price cut volum sale

Krovetz stemmer:
document describe marketing strategy carry company agriculture chemical report prediction market share chemical report market statistic agrochem pesticide herbicide fungicide insecticide fertilizer predict sale stimulate demand price cut volume sale
Phrases

• Many queries are 2-3 word phrases

• Phrases are
  – More precise than single words
    • e.g., documents containing “black sea” vs. two words “black” and “sea”
  – Less ambiguous
    • e.g., “big apple” vs. “apple”

• Can be difficult for ranking
  • e.g., Given query “fishing supplies”, how do we score documents with
    – exact phrase many times, exact phrase just once, individual words in same sentence, same paragraph, whole document, variations on words?

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Phrases

• Text processing issue – how are phrases recognized?

• Three possible approaches:
  – Identify syntactic phrases using a part-of-speech (POS) tagger
  – Use word n-grams
  – Store word positions in indexes and use proximity operators in queries

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
POS Tagging

• POS taggers use statistical models of text to predict syntactic tags of words
  – Example tags:
    • NN (singular noun), NNS (plural noun), VB (verb), VBD (verb, past tense), VBN (verb, past participle), IN (preposition), JJ (adjective), CC (conjunction, e.g., “and”, “or”), PRP (pronoun), and MD (modal auxiliary, e.g., “can”, “will”).

• Phrases can then be defined as simple noun groups, for example

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Original text:
Document will describe marketing strategies carried out by U.S. companies for their agricultural chemicals, report predictions for market share of such chemicals, or report market statistics for agrochemicals, pesticide, herbicide, fungicide, insecticide, fertilizer, predicted sales, market share, stimulate demand, price cut, volume of sales.

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Word N-Grams

• POS tagging too slow for large collections
• Simpler definition – phrase is any sequence of \( n \) words – known as \( n \)-grams
  – bigram: 2 word sequence, trigram: 3 word sequence, unigram: single words
  – N-grams also used at character level for applications such as OCR
• N-grams typically formed from overlapping sequences of words
  – i.e. move n-word “window” one word at a time in document

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
N-Grams

• Frequent n-grams are more likely to be meaningful phrases

• N-grams form a Zipf distribution
  – Better fit than words alone

• Could index all n-grams up to specified length
  – Much faster than POS tagging
  – Uses a lot of storage
    • e.g., document containing 1,000 words would contain 3,990 instances of word n-grams of length 2 ≤ n ≤ 5

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Google N-Grams

• Web search engines index n-grams
• Google sample:

  Number of tokens: 1,024,908,267,229
  Number of sentences: 95,119,665,584
  Number of unigrams: 13,588,391
  Number of bigrams: 314,843,401
  Number of trigrams: 977,069,902
  Number of fourgrams: 1,313,818,354
  Number of fivegrams: 1,176,470,663

• Most frequent trigram in English is “all rights reserved”
  – In Chinese, “limited liability corporation”

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Document Structure and Markup

• Some parts of documents are more important than others

• Document parser recognizes structure using markup, such as HTML tags
  – Headers, anchor text, bolded text all likely to be important
  – Metadata can also be important
  – Links used for link analysis

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Example Web Page

Tropical fish

From Wikipedia, the free encyclopedia

Tropical fish include fish found in tropical environments around the world, including both freshwater and salt water species. Fishkeepers often use the term tropical fish to refer only those requiring fresh water, with saltwater tropical fish referred to as marine fish.

Tropical fish are popular aquarium fish, due to their often bright coloration. In freshwater fish, this coloration typically derives from iridescence, while salt water fish are generally pigmented.
Example Web Page

<html>

...
</body></html>
Link Analysis

• Links are a key component of the Web
• Important for navigation, but also for search
  – e.g., <a href="http://example.com" >Example website</a>
  – “Example website” is the anchor text
  – “http://example.com” is the destination link
  – both are used by search engines

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Anchor Text

• Used as a description of the content of the *destination page*
  – i.e., collection of anchor text in all links pointing to a page used as an additional text field

• Anchor text tends to be short, descriptive, and similar to query text

• Retrieval experiments have shown that anchor text has significant impact on effectiveness for *some types of queries*
  – i.e., more than PageRank

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
PageRank

• Billions of web pages, some more informative than others

• Links can be viewed as information about the *popularity* (*authority?*) of a web page
  – can be used by ranking algorithm

• *Inlink* count could be used as simple measure

• Link analysis algorithms like PageRank provide more reliable ratings
  – less susceptible to link spam

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Random Surfer Model

• Browse the Web using the following algorithm:
  – Choose a random number $r$ between 0 and 1
  – If $r < \lambda$:
    • Go to a random page
  – If $r \geq \lambda$:
    • Click a link at random on the current page
  – Start again

• PageRank of a page is the probability that the “random surfer” will be looking at that page
  – links from popular pages will increase PageRank of pages they point to

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Dangling Links

• Random jump prevents getting stuck on pages that
  – do not have links
  – contains only links that no longer point to other pages
  – have links forming a loop

• Links that point to the first two types of pages are called *dangling links*
  – may also be links to pages that have not yet been crawled

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
PageRank

- PageRank ($PR$) of page $C = \frac{PR(A)}{2} + \frac{PR(B)}{1}$
- More generally,

$$PR(u) = \sum_{v \in B_u} \frac{PR(v)}{L_v}$$

- where $B_u$ is the set of pages that point to $u$, and $L_v$ is the number of outgoing links from page $v$ (not counting duplicate links)
PageRank

• Don’t know PageRank values at start
• Assume equal values (1/3 in this case), then iterate:
  – first iteration: $PR(C) = \frac{0.33}{2} + 0.33 = 0.5$, $PR(A) = 0.33$, and $PR(B) = 0.17$
  – second: $PR(C) = \frac{0.33}{2} + 0.17 = 0.33$, $PR(A) = 0.5$, $PR(B) = 0.17$
  – third: $PR(C) = 0.42$, $PR(A) = 0.33$, $PR(B) = 0.25$
• Converges to $PR(C) = 0.4$, $PR(A) = 0.4$, and $PR(B) = 0.2$

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
PageRank

- Taking random page jump into account, 1/3 chance of going to any page when \( r < \lambda \)

\[
PR(C) = \frac{\lambda}{3} + (1 - \lambda) \cdot \left( \frac{PR(A)}{2} + \frac{PR(B)}{1} \right)
\]

- More generally,

\[
PR(u) = \frac{\lambda}{N} + (1 - \lambda) \cdot \sum_{v \in B_u} \frac{PR(v)}{L_v}
\]

- where \( N \) is the number of pages, \( \lambda \) typically 0.15

26: \textbf{end while} \\
27: \textbf{return } R \\
28: \textbf{end procedure}
A PageRank Implementation

• Preliminaries:
  – 1) Extract links from the source text. You'll also want to extract the URL from each document in a separate file. Now you have all the links (source-destination pairs) and all the source documents
  – 2) Remove all links from the list that do not connect two documents in the corpus. The easiest way to do this is to sort all links by destination, then compare that against the corpus URLs list (also sorted)
  – 3) Create a new file \( I \) that contains a (url, pagerank) pair for each URL in the corpus. The initial PageRank value is \( 1/#D \) (#D = number of urls)

• At this point there are two interesting files:
  – \([L]\) links (trimmed to contain only corpus links, sorted by source URL)
  – \([I]\) URL/PageRank pairs, initialized to a constant

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
A PageRank Implementation

- Preliminaries - Link Extraction from .corpus file using Galago

  DocumentSplit -> IndexReaderSplitParser -> TagTokenizer

  split = new DocumentSplit ( filename, filetype, new byte[0], new byte[0] )

  index = new IndexReaderSplitParser ( split )

  tokenizer = new TagTokenizer ( )

  tokenizer.setProcessor ( NullProcessor ( Document.class ) )

  doc = index.nextDocument ( )

  tokenizer.process ( doc )

  - doc.identifier contains the file’s name
  - doc.tags now contains all tags
  - Links can be extracted by finding all tags with name “a”
  - Links should be processed so that they can be compared with some file name in the corpus
A PageRank Implementation

Iteration:
• Steps:
  1. Make a new output file, R.
  2. Read L and I in parallel (since they're all sorted by URL).
  3. For each unique source URL, determine whether it has any outgoing links:
     4. If not, add its current PageRank value to the sum: T (terminals).
     5. If it does have outgoing links, write (source_url, dest_url, Ip/|Q|),
        where Ip is the current PageRank value, |Q| is the number of outgoing links,
        and dest_url is a link destination. Write this to R.
    6. Sort R by destination URL.
  7. Scan R and I at the same time. The new value of Rp is:
     (1 - lambda) / #D (a fraction of the sum of all pages)
     plus: lambda * sum(T) / #D (the total effect from terminal pages),
     plus: lambda * all incoming mass from step 5.
  8. Check for convergence
  9. Write new Rp values to a new I file.

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
A PageRank Implementation

• Convergence check
  – Stopping criteria for this type of PR algorithm typically is of the form \( ||\text{new} - \text{old}|| < \tau \) where new and old are the new and old PageRank vectors, respectively.
  – \( \tau \) is set depending on how much precision you need. Reasonable values include 0.1 or 0.01. If you want really fast, but inaccurate convergence, then you can use something like \( \tau = 1 \).
  – The setting of \( \tau \) also depends on \( N \) (= number of documents in the collection), since \( ||\text{new-old}|| \) (for a fixed numerical precision) increases as \( N \) increases, so you can alternatively formulate your convergence criteria as \( ||\text{new} - \text{old}|| / N < \tau \).
  – Either the L1 or L2 norm can be used.

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Link Quality

• Link quality is affected by spam and other factors
  – e.g., *link farms* to increase PageRank
  – *trackback links* in blogs can create loops
  – links from comments section of popular blogs
    • Blog services modify comment links to contain *rel=nofollow* attribute
      • e.g., “Come visit my <a rel=nofollow href="http://www.page.com">web page</a>.”
Trackback Links

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Information Extraction (IE)

• Automatically extract structure from text
  – annotate document using tags to identify extracted structure

• Named entity recognition (NER)
  – identify words that refer to something of interest in a particular application
  – e.g., people, companies, locations, dates, product names, prices, etc.

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Named Entity Recognition (NER)

Fred Smith, who lives at 10 Water Street, Springfield, MA, is a long-time collector of tropical fish.

<p>&lt;p&gt;&lt;PersonName&gt;Fred&lt;/GivenName&gt; &lt;Sn&gt;Smith&lt;/Sn&gt; &lt;/PersonName&gt;, who lives at &lt;address&gt;&lt;Street&gt;10 Water Street&lt;/Street&gt;, &lt;City&gt;Springfield&lt;/City&gt;, &lt;State&gt;MA&lt;/State&gt;&lt;/address&gt;, is a long-time collector of &lt;b&gt;tropical fish.&lt;/b&gt;&lt;/p&gt;

• Example showing semantic annotation of text using XML tags

• Information extraction also includes document structure and more complex features such as relationships and events

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Named Entity Recognition

• Rule-based
  – Uses lexicons (lists of words and phrases) that categorize names
    • e.g., locations, peoples’ names, organizations, etc.
  – Rules also used to verify or find new entity names
    • e.g., “<number> <word> street” for addresses
    • “<street address>, <city>” or “in <city>” to verify city names
    • “<street address>, <city>, <state>” to find new cities
    • “<title> <name>” to find new names

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Named Entity Recognition

• Rules either developed manually by trial and error or using machine learning techniques

• **Statistical**
  - uses a probabilistic model of the words in and around an entity
  - probabilities estimated using *training data* (manually annotated text)
  - Hidden Markov Model (HMM)
  - Conditional Random Field (CRF)

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Named Entity Recognition

• Accurate recognition requires about 1M words of training data (1,500 news stories)
  – may be more expensive than developing rules for some applications

• Both rule-based and statistical can achieve about 90% effectiveness for categories such as names, locations, organizations
  – others, such as product name, can be much worse

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Internationalization

• 2/3 of the Web is in English
• About 50% of Web users do not use English as their primary language
• Many (maybe most) search applications have to deal with multiple languages
  – monolingual search: search in one language, but with many possible languages
  – cross-language search: search in multiple languages at the same time

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Internationalization

• Many aspects of search engines are language-neutral

• Major differences:
  – Text encoding (converting to Unicode)
  – Tokenizing (many languages have no word separators)
  – Stemming

• Cultural differences may also impact interface design and features provided

Source: Croft et al. (2008) Search Engines: Information Retrieval in Practice
Chinese “Tokenizing”

1. Original text
旱灾在中国造成的影响
(the impact of droughts in China)

2. Word segmentation
旱灾 在 中国 造成 的 影响
drought at china make impact

3. Bigrams
旱灾 灾在 在中 中国 国造
造成 成的 的影 影响
