Overview of Text Vectorization Methods

Vectorization Method	Function	Good For	Considerations
Frequency	Counts term frequencies	Bayesian models	Most frequent words not always most informative
One-Hot Encoding	Binarizes term occurrence (0, 1)	Neural networks	All words equidistant, so normalization extra important
TF-IDF	Normalizes term frequencies across documents	General purpose	Moderately frequent terms may not be representative of document topics
Distributed Representations	Context-based, continuous term similarity encoding	Modeling more complex relationships	Performance intensive; difficult to scale without additional tools (e.g., Tensorflow)

Encoding Documents as Vectors

Token Frequency as Vector Encoding

BERT

Bidirectional Encoder Representations from Transformers

Pre-training model architectures

BERT uses a bidirectional Transformer.

OpenAI GPT uses a left-to-right Transformer.

ELMo uses the concatenation of independently trained left-to-right and right-to-left LSTM to generate features for downstream tasks.

Among three, only BERT representations are jointly conditioned on both left and right context in all layers.

BERT input representation

The input embeddings is the sum of the token embeddings, the segmentation embeddings and the position embeddings.
