Results of Using Different Evaluation Methods

Methods	Different Evaluation Methods	Representative Epcc (psi)	Estimated Mr (psi)	Calculated Allowable Gross Weight (lbs)	PCN
Ι	Grand Mean	3.67 x 10 ⁶	648.1	700,000	55.0/R/C/W/T
п	Grand Mean - 1 Std.Dev.	2.40 x 10 ⁶	592.8	640,000	48.6/R/C/W/T
Ш	5 Subsections (85%)	3.04 x 10 ⁶	620.7	671,000	51.9/R/C/W/T
IV	10 Subsections (85%)	2.75 x 10 ⁶	608.1	656,000	50.3/R/C/W/T
v	All Separated Data (85%)	2.05 x 10 ⁶	585.1	632,000	47.8/R/C/W/T
VI	95% Confidence	3.33 x 10 ⁶	585.1	684,000	53.3/R/C/W T

VII. Concluding Remarks (1/2)

- According to AC 150/5370-11A's recommendation, the mean value minus one standard deviation (or the so-called 85% confidence level) may be used to obtain a more conservative evaluation or design input.
- Nevertheless, it was found that this procedure is not based on sound statistical principles especially when the probability distribution function of the population is almost always unknown and is not necessarily normal.

VII. Concluding Remarks (2/2)

- Consequently, the concepts of random sampling, central limit theorem, and confidence intervals for hypothesis testing were adopted.
- It was proposed that a single representative design input for the entire runway pavement be determined by the lower limit of 95% confidence level (1-tail) to derive a more consistent and repeatable PCN value.
- A case study was conducted to illustrate the potential problems of the existing ACN/PCN procedure and the benefits of the proposed revisions.
